

## RCP 30, 31: P+PI cascade controller

### How energy efficiency is improved

Enables the implementation of individually optimised controls for maximum efficiency in pneumatic installations.

### Areas of application

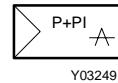

Room-temperature control (P) with supply-air temperature as auxiliary control loop (PI) in ventilation and air-conditioning equipment. Pneumatic control of temperature, pressure, differential pressure, humidity and flow rate in combination with appropriate transducers.

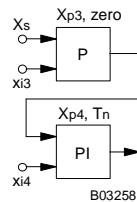

T03053

### Features

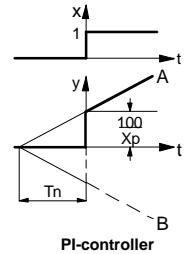

- P+PI cascade controller
- P+PI cascade schedule controller
- Controllers can be used universally for the most varied of applications
- Housing, rack and front doors made of thermoplastic
- Suitable for wall or panel mounting
- Functional description and commissioning help inserted in front door
- Front panel with adjusters and 3 covered recesses for plug-in pressure gauge (XMP) making commissioning easier
- Setpoint adjuster XS adjustable manually with scales for all Centair measuring ranges
- All settings very easy to make with a coin and % scale
- M4 measuring connections, control action adjustable (delivered with control action B)
- Compressed-air connections Rp 1/8" female thread
- Complies with directive 97/23/EC Art. 3.3 on pressure equipment

Y03249

B03258

B02214

### Technical description

- Supply pressure 1.3 bar  $\pm$  0.1
- Easily accessible adjusters for XS (setpoint), X P4 (P range), Tn (reset time), E (influence) and FF (schedule start point)
- Inputs for:
  - remote setpoint adjustment
  - main controlled variable
  - auxiliary controlled variable
  - command variable
- Outputs for:
  - output pressure for dampers or actuator

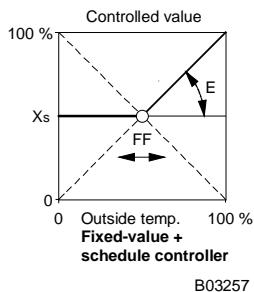

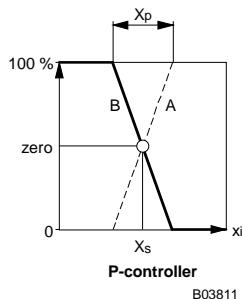

Type	Description	Air capacity l/h	Air consumption <sup>1)</sup> l/h	Weight kg
<b>RCP 30 F001</b>	fixed-value controller, P+PI	400	70	0,7
<b>RCP 31 F001</b>	fixed-value + schedule controller, P+PI	400	90	0,7
<b>RCP 30:</b>				
Setpoint XS	0...100%

### Operation

#### RCP 30 and RCP 31

The transducer at connection 3 converts the control variable into the pneumatic standard signal 0,2...1,0 bar (equivalent to 0...100%) within its measuring range. This actual-value signal  $x_{i3}$  is compared with the fixed setpoint  $X_s$ .

Depending on the P-band  $X_{P3}$ , the control deviation is amplified by a P-controller (master), limited by limiter B to a (variable) minimum value, and then fed as the command variable to a PI-controller (slave). When the actual value is equal to the setpoint ( $x_{i3} = X_s$ ), the PI-controller controls to the value zero = 50%, i.e. to a value that is 50% of the transducer range at connection 4.

With a pressure of 0,2...1,0 bar at input 6, the setpoint can be set remotely from 0...100%. The internal setpoint setting then functions as a minimum limitation.

A restrictor ( $\varnothing 0,2$  mm) for supplying the transducer is fitted at connections 3 and 4. The signals from the transducer and the output pressure can be checked via the M4 measuring connection or shown via the manometer.

#### RCP 31: additional functions

The transducer at connection 5 converts the command variable (e.g. outside temperature) into the pneumatic standard signal 0,2...1,0 bar (equivalent to 0...100%). This signal ( $x_{i5}$ ) is fed to the command circuit which, together with the setting parameters FF and E, creates a program for the setpoint shift of the following P-controller (master). The characteristic for the influence E can be placed in any of the four quadrants.

Because the outside temperature is often fed to more than one controller, the transducer at connection 5 must be supplied by a separate ( $\varnothing 0,2$  mm) restrictor.

### Additional details

RCP 30: Front plate with adjusters for setpoint ( $X_s$ ), P-bands ( $X_{P3}, X_{P4}$ ), zero, reset time ( $T_n$ ) and minimum limitation (B).

RCP 31: Front plate with adjusters for setpoint, P-bands, ( $X_{P3}, X_{P4}$ ), zero, reset time, minimum limitation, influence (E) and shift starting point (FF).

### Additional information on accessories
